

5.1

$$G_0 = - \frac{\beta R_c}{R_e}$$

$$i_c = \beta i_b$$

$$\left. \begin{aligned} V_s &= -\beta R_c i \\ V_e &= R_e i + R(i + \beta i) \end{aligned} \right\} G = \frac{V_s}{V_e} = - \frac{\beta R_c}{R_e + R(\beta + 1)}$$

$$\beta = 100 \Rightarrow \beta + 1 \approx \beta \Rightarrow G = - \frac{\beta R_c}{R_e + \beta R}$$

$$G_1 = - \beta \frac{R_c}{R_e} \cdot \frac{1}{(1 + \beta \frac{R}{R_e})} = G_0 \frac{1}{1 + \beta \frac{R}{R_e}} = \frac{G_0}{1 + G_0 H}$$

$$G_0 H = \beta \frac{R}{R_e} \Rightarrow H = \frac{\beta R}{R_e} \cdot \frac{R_e}{(-\beta R_c)} = - R/R_c$$
